

Daily Scrum 01 (Technical Session)

Date	14 May 2026
Time	5:07 PM
Duration	Approximately 19 minutes
Meeting Type	Daily Scrum / Technical Collaboration
Attendees	Nasiphi Ntontela, Lungani Shezi, Mkatoko Chauke, Mutsawashe Njowa, Tendai Dhlamin
Absentees	Dorsa Shahrokh (noted as busy)
Facilitator	Nasiphi Ntontela

1. Codebase Synchronisation Issues

The meeting opened with technical difficulties related to the shared repository. Tendai was found to be running an outdated version of the codebase, as he had not pulled the most recent commits. This resulted in a discrepancy between his local environment and the working branch.

A separate merge conflict was identified during the session. Mutsawashe had pushed changes to HTML files approximately two hours prior to the meeting, specifically modifications to the admin dashboard (index.html), which she described as removing unnecessary div elements. This caused a merge conflict for Mkatoko when he attempted to commit his own changes.

The team walked Mkatoko through the process of resolving the merge conflict in Visual Studio Code using the source control panel, identifying conflicting changes and staging the resolved files.

2. Meeting Structure Debate

Mkatoko raised a procedural point, suggesting that the team adhere to daily scrum principles, specifically the structure of sharing what has been completed, what is planned, and any blockers. He recommended that debugging and live technical work be conducted in separate sessions.

Nasiphi and Lungani acknowledged the suggestion but noted that, given the project is in its final stages, there are no longer formal backlogs or new tasks to report. The meeting format was considered appropriate for the current phase.

3. Multi-Language Support Proposal

Tendai proposed the addition of a language translation feature to the application, citing the South African context and the fact that not all users may be proficient in English. He indicated he had been researching implementation approaches and offered to take this on.

Lungani recommended the team complete existing work before introducing new features. Nasiphi supported the idea provided it did not interfere with Tendai's current assigned tasks.

4. Appointment Notification (Cron Job)

Tendai confirmed he had updated the cron job responsible for sending appointment reminders to patients ahead of their scheduled appointments. This was noted as complete.

5. Staff Notes Feature

Nasiphi highlighted a pending task relating to staff members adding clinical notes to patient records. Tendai acknowledged the task and indicated he was prepared to take it on.

6. Patient Assignment to Staff

Lungani noted that a mechanism for assigning patients to specific staff members remained outstanding. This was flagged as an important pending item.

Action Items

- Tendai: Implement the staff notes feature (adding notes to patient records).
- Tendai: Explore multi-language translation feature — not to interfere with primary tasks.
- All members: Pull latest changes before committing to avoid repeat merge conflicts.
- Outstanding: Patient-to-staff assignment functionality to be allocated.

Daily Scrum 02 (Sprint Wind-Down)

Date	14 May 2026
Time	5:27 PM

Duration	Approximately 8 minutes
Meeting Type	Daily Scrum — Continuation of Meeting 2
Attendees	Nasiphi Ntontela, Lungani Shezi, Mkatoko Chauke, Mutsawashe Njowa, Tendai Dhlamin
Facilitator	Nasiphi Ntontela

1. Patient-to-Staff Assignment

The meeting continued from the previous session. The team revisited the outstanding feature of assigning a patient record to a staff member upon booking an appointment. This was identified as a key pending deliverable.

2. Receptionist Role and Appointment Booking Logic

Mkatoko raised the question of how appointment booking logic should interact with the new receptionist role. He noted an apparent contradiction: a patient booking an appointment should know which doctor they will see, but the current model allows walk-in booking without specifying a doctor.

Mkatoko confirmed he was actively working on implementing the receptionist role, which would function similarly to the existing staff member account creation process.

He also raised the question of how admin accounts would be authorised to operate at a specific clinic. This remains an open design question.

3. Admin Account Design

The question of admin account structure was raised, specifically how admins would be created and how their access would be scoped to a specific clinic. No definitive solution was agreed upon. Mkatoko requested Mutsawashe's assistance with this task.

Mutsawashe agreed to collaborate on the task.

4. Architectural Style

Mkatoko raised a question about whether the team needed to document architectural styles for the final submission. Lungani suggested the project most closely aligned with a Factory pattern, though this was not confirmed. Mutsawashe indicated she did not think this required urgent attention.

5. Individual Progress Updates

- Mutsawashe: Removed redundant themes from HTML files.
- Mkatoko: Starting work on the receptionist role and admin account features; aiming to be done by the following day.

- Mutsawashe: Available for additional tasks; declined to take on the activity diagram but agreed to assist Mkatoko with the admin task.

Action Items

- Mkatoko and Mutsawashe: Collaborate on receptionist role and admin account implementation.
- Team: Resolve patient-to-staff assignment ownership.
- Mkatoko: Share progress on the receptionist role and walk-in booking logic.

Daily Scrum 03 — Deployment Working Session

Date	16 May 2026
Time	6:57 PM
Duration	Approximately 20 minutes
Meeting Type	Technical Working Session — Azure Deployment
Attendees	Lungani Shezi, Mutsawashe Njowa, Dorsa Shahrokh, Mkatoko Chauke, Tendai Dhlamin
Facilitator	Lungani Shezi

1. Azure Web App Deployment

The primary focus of this session was deploying the application (named “HealthFlow”) to Microsoft Azure. Mutsawashe shared her screen to walk through the Azure Portal configuration process with the team.

A resource group was created under the name “health-group”. The team selected GitHub as the deployment source and configured the app service settings.

2. Azure Policy Violation Errors

The team encountered repeated policy violation errors during the deployment process. Multiple Azure regions were attempted, including West Europe and Canada, but each attempt resulted in the same error. It was determined that the student subscription in use had regional restrictions that prevented deployment to certain locations.

The team consulted Azure Copilot for guidance on the error. It was found that the student subscription lacked the necessary permissions to deploy in the selected regions.

The team investigated whether switching from the standard to the free tier would resolve the issue, without success.

The session concluded without a successful deployment, as the team was unable to identify a region compliant with the student subscription’s policy constraints.

3. Subscription and Account Clarifications

It was clarified during the session that a personal Azure account had previously been used for an earlier deployment. The team acknowledged that the student subscription had different constraints and that the previous configuration may not be replicable under this account type.

Dorsa suggested checking whether changing the account location from Canada to the United States would resolve the regional restriction. This was explored but did not yield a different result.

4. Next Steps on Deployment

The team agreed to share the Azure error message details via the group chat for further investigation. Mutsawashe sent the error output to the group.

Action Items

- Team: Investigate Azure student subscription policy constraints and identify a compatible deployment region.
- Dorsa: Follow up with Copilot/Azure documentation on resolving policy violation errors under student subscriptions.
- All members: Ensure local environments are up to date and application is deployment-ready once the Azure issue is resolved.

Outstanding Action Items — Summary

Action Item	Responsible	Status
Attach README files to all user story uploads	All members	Ongoing
Review submission guidelines individually	All members	Pending

Activity diagram	Nasiphi Ntontela / TBD	In Progress
Receptionist availability feature integration	Mkateko / Lungani	In Progress
Staff notes (adding notes to patient records)	Tendai Dhlamin	In Progress
Appointment notifications (cron job)	Tendai Dhlamin	Complete
Patient-to-staff assignment on booking	TBD	Pending
Receptionist role implementation	Mkateko Chauke	In Progress
Admin account design and authorisation	Mkateko & Mutsawashe	In Progress
Multi-language support feature	Tendai Dhlamin	Exploratory
Azure deployment — resolve policy violations	All / Dorsa	Pending
